WO 2007/040440 A1

New pyrimidine derivatives and their use in therapy as well as the use of pyrimidine derivatives in the manufacture of a medicament for prevention and/or treatment of Alzheimer's disease.

TECHNICAL FIELD OF INVENTION

The present invention relates to new compounds of formula **I**, as a free base or a pharmaceutically acceptable salt, solvate or solvate of salt thereof, to pharmaceutical formulations containing said compounds and to the use of said compounds in therapy. The present invention further relates to a process for the preparation of compounds of formula **I** and to new intermediates used therein.

BACKGROUND OF THE INVENTION

Glycogen synthase kinase 3 (GSK3) is a serine / threonine protein kinase composed of two isoforms (α and β), which are encoded by distinct genes but are highly homologous within the catalytic domain. GSK3 is highly expressed in the central and peripheral nervous system. GSK3 phosphorylates several substrates including tau, ß-catenin, glycogen synthase, pyruvate dehydrogenase and elongation initiation factor 2b (eIF2b). Insulin and growth factors activate protein kinase B, which phosphorylates GSK3 on serine 9 residue and inactivates it.

Alzheimer's Disease (AD) dementias, and taupathies

AD is characterized by cognitive decline, cholinergic dysfunction and neuronal death, neurofibrillary tangles and senile plaques consisting of amyloid-β deposits. The sequence of these events in AD is unclear, but they are believed to be related. Glycogen synthase kinase 3β (GSK3β) or Tau (τ) phosphorylating kinase selectively phosphorylates the microtubule associated protein τ in neurons at sites that are hyperphosphorylated in AD brains. Hyperphosphorylated protein τ has lower affinity for microtubules and accumulates as paired helical filaments, which are the main components that constitute neurofibrillary tangles and neuropil threads in AD brains. This results in depolymerization of microtubules, which leads to dying back of axons and neuritic dystrophy. Neurofibrillary tangles are consistently found in diseases such as AD, amyotrophic lateral sclerosis, parkinsonism-dementia of Gaum, corticobasal degeneration, dementia pugilistica and head trauma, Down's syndrome, postencephalatic parkinsonism, progressive supranuclear palsy, Niemann-Pick's Disease and Pick's Disease. Addition of amyloid-β to primary

hippocampal cultures results in hyperphosphorylation of τ and a paired helical filaments-like state via induction of GSK3β activity, followed by disruption of axonal transport and neuronal death (Imahori and Uchida., J. Biochem 121:179-188, 1997). GSK3β preferentially labels neurofibrillary tangles and has been shown to be active in pre-tangle neurons in AD brains. GSK3 protein levels are also increased by 50% in brain tissue from AD patients. Furthermore, GSK3β phosphorylates pyruvate dehydrogenase, a key enzyme in the glycolytic pathway and prevents the conversion of pyruvate to acetyl-Co-A (Hoshi et al., PNAS 93:2719-2723, 1996). Acetyl-Co-A is critical for the synthesis of acetylcholine, a neurotransmitter with cognitive functions. Thus, GSK3β inhibition may have beneficial effects in progression as well as the cognitive deficits associated with Alzheimer's disease and other above-referred to diseases.

Chronic and Acute Neurodegenerative Diseases

Growth factor mediated activation of the PI3K /Akt pathway has been shown to play a key role in neuronal survival. The activation of this pathway results in GSK3β inhibition. Recent studies (Bhat et. al., PNAS 97:11074-11079 (2000)) indicate that GSK3β activity is increased in cellular and animal models of neurodegeneration such as cerebral ischemia or after growth factor deprivation. For example, the active site phosphorylation was increased in neurons vulnerable to apoptosis, a type of cell death commonly thought to occur in chronic and acute degenerative diseases such as Alzheimer's Disease, Parkinson's Disease, amyotrophic lateral sclerosis, Huntington's Disease and HIV dementia, ischemic stroke and head trauma. Lithium was neuroprotective in inhibiting apoptosis in cells and in the brain at doses that resulted in the inhibition of GSK3β. Thus GSK3β inhibitors could be useful in attenuating the course of neurodegenerative diseases.

Bipolar Disorders (BD)

Bipolar Disorders are characterised by manic episodes and depressive episodes. Lithium has been used to treat BD based on its mood stabilising effects. The disadvantage of lithium is the narrow therapeutic window and the danger of overdosing that can lead to lithium intoxication. The recent discovery that lithium inhibits GSK3 at therapeutic concentrations has raised the possibility that this enzyme represents a key target of lithium's action in the brain (Stambolic et al., Curr. Biol. 6:1664-1668, 1996; Klein and Melton; PNAS 93:8455-8459, 1996). Inhibition of GSK3β may therefore be of therapeutic relevance in the treatment of BD as well as in AD patients that have affective disorders.

Schizophrenia

GSK3 is involved in signal transduction cascades of multiple cellular processes, particularly during neural development. Kozlovsky et al (Am J Psychiatry 2000 May;157(5):831-3) found that GSK3β levels were 41% lower in the schizophrenic patients than in comparison subjects. This study indicates that schizophrenia involves neurodevelopmental pathology and that abnormal GSK3 regulation could play a role in schizophrenia. Furthermore, reduced β-catenin levels have been reported in patients exhibiting schizophrenia (Cotter et al., Neuroreport 9:1379-1383 (1998)).

Diabetes

Insulin stimulates glycogen synthesis in skeletal muscles via the dephosphorylation and thus activation of glycogen synthase. Under resting conditions, GSK3 phosphorylates and inactivates glycogen synthase via dephosphorylation. GSK3 is also over-expressed in muscles from Type II diabetic patients (Nikoulina et al., Diabetes 2000 Feb;49(2):263-71). Inhibition of GSK3 increases the activity of glycogen synthase thereby decreasing glucose levels by its conversion to glycogen. GSK3 inhibition may therefore be of therapeutic relevance in the treatment of Type I and Type II diabetes and diabetic neuropathy.

Hair Loss

GSK3 phosphorylates and degrades β-catenin. β-catenin is an effector of the pathway for keratonin synthesis. β-catenin stabilisation may be lead to increase hair development. Mice

expressing a stabilised β-catenin by mutation of sites phosphorylated by GSK3 undergo a process resembling de novo hair morphogenesis (Gat et al., Cell 1998 Nov 25;95 (5):605-14)). The new follicles formed sebaceous glands and dermal papilla, normally established only in embryogenesis. Thus GSK3 inhibition may offer treatment for baldness.

Oral contraceptives

Vijajaraghavan et al. (Biol Reprod 2000 Jun; 62 (6):1647-54) reported that GSK3 is high in motile versus immotile sperm. Immunocytochemistry revealed that GSK3 is present in the flagellum and the anterior portion of the sperm head. These data suggest that GSK3 could be a key element underlying motility initiation in the epididymis and regulation of mature sperm function. Inhibitors of GSK3 could be useful as contraceptives for males.

Bone-related disorders

It has been shown that GSK3 inhibitors could be used for treatment of bone-related disorders. This has been discussed in e.g. Tobias et al., *Expert Opinion on Therapeutic Targets*, Feb 2002, pp 41-56.

It will be appreciated that certain of the various ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halogeno group. Particular examples of modifications include the reduction of a nitro group to an amino group by for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl.

It will also be appreciated that in some of the reactions mentioned herein it may be necessary/desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable and suitable methods for protection are known to those skilled in the art. Conventional protecting groups may be used in accordance with standard practice (for illustration see T.W. Greene, Protective Groups in Organic Synthesis, John Wiley and Sons, 1999). Thus, if reactants include groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxycarbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or *t*-butoxycarbonyl group, an

arylmethoxycarbonyl group, for example benzyloxycarbonyl, or an aroyl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxycarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a *t*-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a *t*-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

The present invention also relates to intermediates for the end products of the present invention. These intermediates are useful in the preparation of a compound of formula I as defined above. These intermediates are represented by, but not limited to, the following

General Methods

All solvents used were analytical grade and commercially available anhydrous solvents were routinely used for reactions. Reactions were typically run under an inert atmosphere of nitrogen or argon.

^{1}H, ^{19}F and ^{13}C NMR spectra were recorded on a Varian Unity+ 400 NMR Spectrometer equipped with a 5mm BBO probehead with Z-gradients, or a Varian Gemini 300 NMR spectrometer equipped with a 5mm BBI probehead, or a Bruker Avance 400 NMR spectrometer equipped with a 60 µl dual inverse flow probehead with Z-gradients, or a Bruker DPX400 NMR spectrometer equipped with a 4-nucleus probehead equipped with Z-gradients, or a Bruker Avance 600 NMR spectrometer equipped with a 5mm BBI probehead with Z-gradients. Unless specifically noted in the examples, spectra were recorded at 400 MHz for proton, 376 MHz for fluorine-19 and 100 MHz for carbon-13. The following reference signals were used: the middle line of DMSO-d_6 δ 2.50 (1H), δ 39.51 (13C); the middle line of CD_3OD δ 3.31 (1H) or δ 49.15 (13C); $CDCl_3$ δ 7.26 (1H) and the middle line of $CDCl_3$ δ 77.16 (13C) (unless otherwise indicated).

Mass spectra were recorded on a Waters LCMS consisting of an Alliance 2795 (LC), Waters PDA 2996 and a ZQ single quadrupole mass spectrometer. The mass spectrometer was equipped with an electrospray ion source (ESI) operated in a positive or negative ion mode. The capillary voltage was 3 kV and cone voltage was 30 V. The mass spectrometer was scanned between *m/z* 100-700 with a scan time of 0.3s. Separations were performed on either Waters X-Terra MS C8 (3.5 µm, 50 or 100 mm x 2.1 mm i.d.) or an ACE 3 AQ (100 mm x 2.1 mm i.d.) obtained from ScantecLab. Flow rates were regulated to 1.0 or 0.3 mL/min, respectively. The column temperature was set to +40 °C. A linear gradient was applied using a neutral or acidic mobile phase system, starting at 100% A (A: 95:5 10 mM NH_4OAc:MeCN, or 95:5 8 mM HCOOH:MeCN) ending at 100% B (MeCN).

Alternatively, mass spectra were recorded on a Waters LCMS consisting of an Alliance 2690 Separations Module, Waters 2487 Dual 1 Absorbance Detector (220 and 254 nm) and a Waters ZQ single quadrupole mass spectrometer. The mass spectrometer was equipped with an electrospray ion source (ESI) operated in a positive or negative ion mode. The

capillary voltage was 3 kV and cone voltage was 30 V. The mass spectrometer was scanned between *m/z* 97-800 with a scan time of 0.3 or 0.8 s. Separations were performed on a Chromolith Performance RP-18e (100 x 4.6 mm). A linear gradient was applied starting at 95% A (A: 0.1% HCOOH (aq.)) ending at 100% B (MeCN) in 5 minutes. Flow rate: 2.0 mL/min.

Alternatively, compound identification was performed on a GC-MS system (GC 6890, 5973N MSD) supplied by Agilent Technologies. The column used was a VF-5 MS, ID 0.25 mm x 15m, 0.25 µm (Varian Inc.). A linear temperature gradient was applied starting at 40 °C (hold 1 min) and ending at +300 °C (hold 1 min), +25 °C/minute. The mass spectrometer was equipped with a chemial ionisation (CI) ion source and the reactant gas was methane. The mass spectrometer was equipped with an electron impact (EI) ion source and the electron voltage was set to 70 eV. The mass spectrometer scanned between *m/z* 50-500 and the scan speed was set to 3.25 scan/s.

Microwave heating was performed in a single-mode microwave cavity producing continuous irradiation at 2450 MHz.

HPLC analyses were performed on an Agilent HP1000 system consisting of G1379A Micro Vacuum Degasser, G1312A Binary Pump, G1367A Well plate auto-sampler, G1316A Thermostatted Column Compartment and G1315B Diode Array Detector. Column: X-Terra MS, Waters, 3.0 x 100 mm, 3.5 µm. The column temperature was set to +40 °C and the flow rate to 1.0 ml/min. The Diode Array Detector was scanned from 210-300 nm, step and peak width were set to 2 nm and 0.05 min, respectively. A linear gradient was applied, starting at 100 % A (A: 95:5 10 mM NH_4OAc:MeCN) and ending at 100% B (B: MeCN), in 4 min.

Alternatively, HPLC analyses were performed on a Gynkotek P580 HPG consisting of gradient pump with a Gynkotek UVD 170S UV-vis.-detector equipped with a Chromolith Performance RP column (C18, 100 mm x 4.6 mm). The column temperature was set to +25 °C. A linear gradient was applied using MeCN/0.1 trifluoroacetic acid in MilliQ water, run from 10% to 100% MeCN in 5 minutes. Flow rate: 3 ml/min.

A typical workup procedure after a reaction consisted of extraction of the product with a solvent such as ethyl acetate, washing with water followed by drying of the organic phase over $MgSO_4$ or Na_2SO_4, filtration and concentration of the solution *in vacuo*.

Thin layer chromatography (TLC) was performed on Merck TLC-plates (Silica gel 60 F_{254}) and UV visualized the spots. Flash chromatography was performed on a Combi Flash® Companion™ using RediSep™ normal-phase flash columns or using Merck Silica gel 60 (0.040-0.063 mm). Typical solvents used for flash chromatography were mixtures of chloroform/methanol, dichloromethane/methanol, heptane/ethyl acetate, chloroform/methanol/ammonia (aq.) and dichlorormethane/methanol/ NH_3 (aq.). SCX ion exchange columns were performed on Isolute® columns. Chromatography through ion exchange columns were typically performed in solvents such a methanol.

Preparative chromatography was run on a Waters autopurification HPLC with a diode array detector. Column: XTerra MS C8, 19 x 300 mm, 10 μm. Narrow gradients with MeCN/(95:5 0.1M NH_4OAc:MeCN) were used at a flow rate of 20 ml/min. Alternatively, purification was achieved on a semi preparative Shimadzu LC-8A HPLC with a Shimadzu SPD-10A UV-vis.-detector equipped with a Waters Symmetry® column (C18, 5 μm, 100 mm x 19 mm). Narrow gradients with MeCN/0.1% trifluoroacetic acid in MilliQ Water were used at a flow rate of 10 ml/min.

The formation of hydrochloride salts of the final products were typically performed in solvents or solvents mixtures such as diethyl ether, tetrahydrofuran, dichloromethane/toluene, dichloromethane/methanol, followed by addition of 1M hydrogen chloride in diethyl ether.

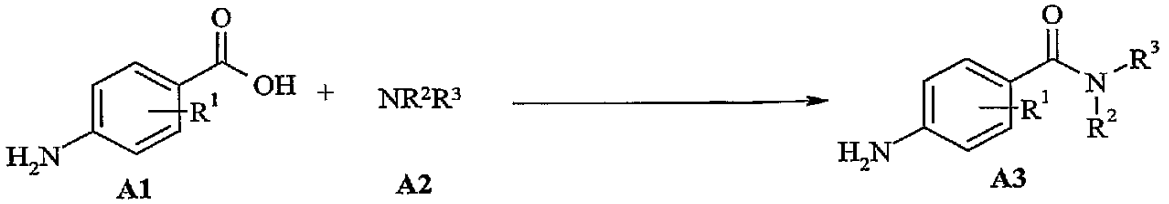
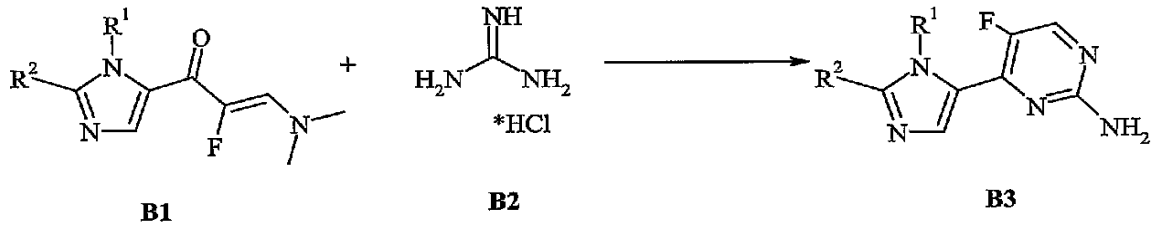
In the following general methods A to I, the groups R^1, R^2, R^3 and R^4 are used independantly to indicate the diversity of substitution within each structure. The identity of R^1, R^2, R^3 and R^4 will be clear to a person skilled in the art based on the starting materials and intermediates for each specific example. For instance in Example 39, which refers to General method E, E1 is 4-[2-methyl-1-(tetrahydro-2*H*-pyran-4-yl)-1*H*-imidazol-5-yl]pyrimidin-2-amine such that R^1 is tetrahydropyranyl, R^3 is methyl and R^4 is hydrogen and E2 is 1-bromo-4-(methylsulfonyl)benzene such that R^2 is sulphonylmethane *para* to the halogen.

General Method A



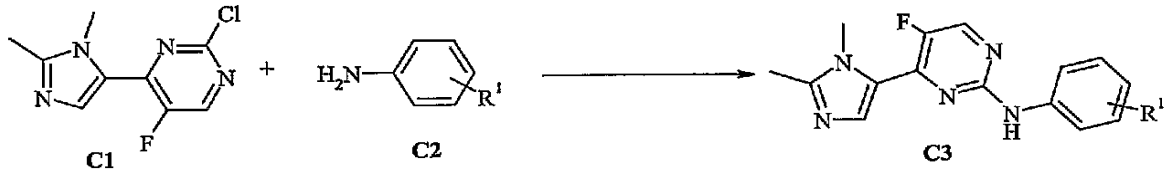
(*i*-Pr)$_2$NEt (2.1 equiv.), HOBt (1.05 equiv.), EDC hydrochloride (1.05 equiv.) and the amine A2 (1.05 equiv.) were added to a stirred solution of the benzoic acid A1 (1.0 equiv.) in anhydrous DMF at r.t.. After 15 h, the reaction mixture was poured onto water and extracted with EtOAc. The organic layer was washed with water and brine, dried (Na_2SO_4), filtered and evaporated *in vacuo* to afford the crude product, which was used in the next step without further purification.

General Method B



A reaction mixture of B1 (1.0 equiv.), guanidine hydrochloride B2 (4.0 equiv.) and sodium methoxide (4.0 equiv.) in 1-butanol was heated in a microwave reactor for 10 minutes at +140 °C under argon or nitrogen atmosphere. The mixture was filtered and the filter was rinsed with CH_2Cl_2. The solvent was evaporated *in vacuo* and the crude product was purified using flash column chromatography.

General Method C



2-Chloro-4-(1,2-dimethyl-1*H*-imidazol-5-yl)-5-fluoropyrimidine C1 (1.0 equiv.), aniline C2 (1.1 equiv.) and sodium tert-butoxide (1.4 equiv.) were mixed in 1,4-dioxane and the mixture was flushed with argon for 5 minutes. $Pd(OAc)_2$ (0.05 equiv.) and Pd(*t*-$Bu_3P)_2$

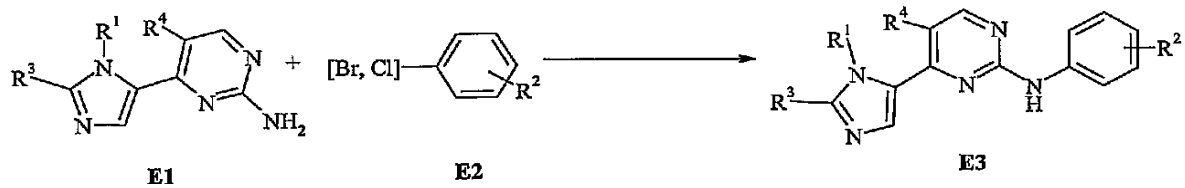
(0.05 equiv.) were added and the reaction was stirred for 15 h at +110 °C. The solvent was removed *in vacuo* and the residue was partitioned between EtOAc and water. After extraction the organic layer was dried ($MgSO_4$), filtered and evaporated *in vacuo* to afford a crude material which was purified by preparative HPLC.

General Method D

D1 **D2** **D3**

D1 (1.0 equiv.), **D2** (0.85-1.24 equiv.) and sodium tert-butoxide (1.34-1.46 equiv.) were mixed in 1,4-dioxane and the mixture was flushed with argon for 5-10 minutes before $Pd(OAc)_2$ (0.04-0.082 equiv.) and $Pd(t\text{-}Bu_3P)_2$ (0.044-0.06 equiv.) were added. The mixture was flushed with argon then heated in a sealed tube at +110-+120 °C until the reaction was complete (as monitored by TLC or LC-MS). If the reaction was not complete after 24 h more $Pd(OAc)_2$, $Pd(t\text{-}Bu_3P)_2$ and sodium tert-butoxide were added. The solvent was removed *in vacuo* and the residue was partitioned between CH_2Cl_2 and water. After extraction the organic layer was dried (Na_2SO_4), filtered and evaporated. The crude of the free base was purified using preparative HPLC. MeCN was evaporated *in vacuo* and the aqueous phase was extracted with CH_2Cl_2. The organic phase was washed with water at pH 9 (diluted $NaHCO_3$ solution), dried (Na_2SO_4), filtered and evaporated. The residue was dissolved in CH_2Cl_2 and the HCl-adduct of the product was precipitated from the solution by addition of 0.1M HCl in ether (1-5 equiv. HCl). The solvent was evaporated and the residue was dissolved in water and freeze dried.

General Method E



E1 **E2** **E3**

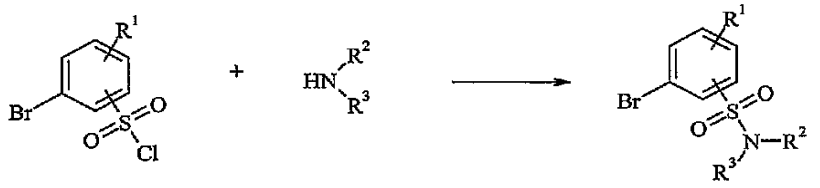
E1 (0.85-1.27 equiv.), **E2** (1.0 equiv.) and Cs_2CO_3 (1.29-2.25 equiv.) were mixed in anhydrous 1,4-dioxane and the mixture was flushed with argon for 5-10 minutes before

$Pd_2(dba)_3$ (0.02-0.08 equiv.) and X-Phos (0.04-0.16 equiv.) were added. The mixture was flushed with argon, then heated in a sealed tube at +90-+100 °C until the reaction was complete.

Workup and purification was performed according to either procedure A, B or C as follows. *Procedure A)* The solvent was removed *in vacuo* and the residue was taken up in CH_2Cl_2 and washed with diluted $NaHCO_3$ (aq.) or water. The organic layer was dried (Na_2SO_4), filtered and evaporated. The crude of the base product was purified using preparative HPLC. *Procedure B)* The reaction mixture was diluted with H_2O or a mixture of $H_2O/CHCl_3$, the product was extracted with $CHCl_3$, the combined organic phases was, if needed, dried (Na_2SO_4), filtered, concentrated and purified using flash column chromatography. *Procedure C)* The reaction mixture was diluted with CH_2Cl_2, filtered and evaporated. The residue was taken up in CH_2Cl_2 and the organic phase was washed with H_2O. Residual water was removed from the organic phase either by treatment with Na_2SO_4 or addition of absolute EtOH before evaporation. The crude of the base product was purified using preparative HPLC.

Alternatively, the general example above was followed but with a slight modification in the order of addition of reagents. For example Cs_2CO_3 can be added together with E1 and E2 before the first argon flush.

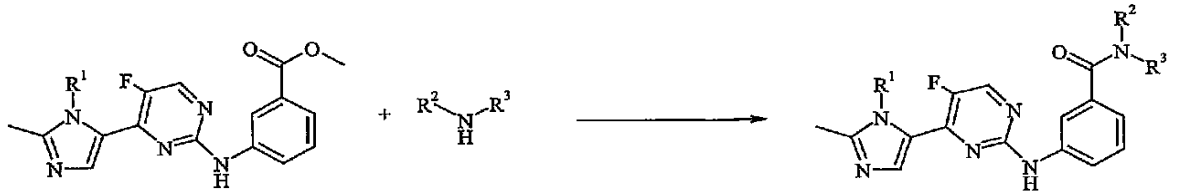
General Method F



F1 **F2** **F3**

F1 (1 equiv) was dissolved in CH_2Cl_2 (2 mL) and **F2** (1.0-1.1 equiv) was added. The reaction mixture was stirred at room temperature for 3 hours whereafter it was washed with saturated $NaHCO_3$ (2 mL). The organic phase was dried (Na_2SO_4), filtered and concentrated to afford **F3**.

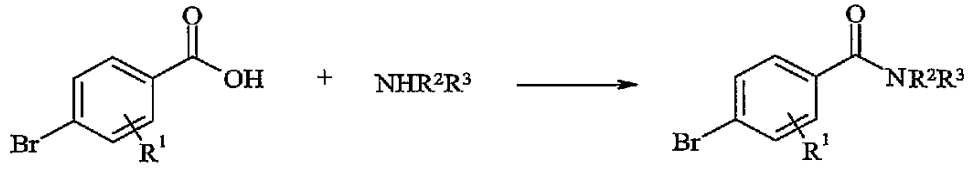
General Method G



G1 G2 G3

G1 (1.0 equiv.) and **G2** (6.0 equiv.) was mixed in toluene (1 - 4 mL) in a thick walled vial of ~10 mL volume and an inert atmospere (Ar or N_2) was established. The sealed vial was cooled in an oil bath (r.t.) or in a dry-ice / ethanol bath (-70°C) and $Al(CH_3)_3$, (2M in toluene) (10 equiv.) was added by a syringe. The reaction mixture was heated in an oil-bath at +90-100°C for 1–4 h, cooled to r.t., and added dropwise into ice-cold sat. $NaHCO_3$ (aq) under vigorous stirring. The product was extracted with CH_2Cl_2 and the organic layer was dried, either by treatment with Na_2SO_4 or addition of absolute EtOH before evaporation. The crude base of the product was purified using flash column chromatography or preparative HPLC.

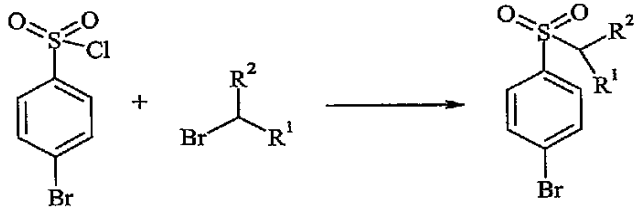
General Method H



H1 H2 H3

Thionyl chloride (5 mL) was added to **H1** (1.0 equiv.). After addition of 2 drops of anhydrous DMF, the reaction mixture was refluxed for 15-30 minutes under an atmosphere of nitrogen. The solvent was evaporated *in vacuo* and the residue was dissolved in CH_2Cl_2 (until a clear solution was obtained). **H2** (1.0 equiv .) was added dropwise followed by addition of triethylamine (1.0 equiv .). The reaction mixture was stirred at r.t. for 15-30 minutes before it was diluted with CH_2Cl_2, washed with saturated $NaHCO_3$ (aq.), dried (Na_2SO_4) and filtered. The solvent was evaporated *in vacuo* and the crude product was purified using flash column chromatography.

General Method I



I1 I2 I3

Sulfones of the type **I3** were prepared following a modified procedure from Richard W. Brown (*J. Org. Chem.* **1991**, *56*, 4974-4976). 4-Bromobenzenesulfonyl chloride (**I1**, 1 equiv.), Na_2SO_3 (1 equiv.) and $NaHCO_3$ (3 equiv.) in water (0.2M) were stirred at +90°C for 1 hour. **I2** (1-3 equiv.) was then added and the resulting mixture stirred at +50-100 °C until the formation of the sulfone **I3** was completed according to GC-MS analysis. Water was added to the reaction mixture and extracted with DCM. After extraction the organic layer was dried ($MgSO_4$), filtered and evaporated *in vacuo* to afford a crude material which was purified by flash chromatography.

Examples 69-91

The following Examples were prepared according to the procedure described in Examples 66 and 68 except that the quantity of DIPEA used in each case was adjusted depending on whether the starting amine was a free base, mono- or higher salt. 3 equivalents of DIPEA were used for amines that were freebases and one additional equivalent was added for every additional salt. The group R is an amine connected *via* the nitrogen to form an amide.

Pharmacology

Determination of ATP competition in Scintillation Proximity GSK3β Assay.

GSK3β scintillation proximity assay.

The competition experiments were carried out in duplicate with 10 different concentrations of the inhibitors in clear-bottom microtiter plates (Wallac, Finland). A biotinylated peptide substrate, Biotin-Ala-Ala-Glu-Glu-Leu-Asp-Ser-Arg-Ala-Gly-Ser(PO_3H_2)-Pro-Gln-Leu (AstraZeneca, Lund), was added at a final concentration of 1 μM in an assay buffer containing 1 mU recombinant human GSK3β (Dundee University, UK), 12 mM

morpholinepropanesulfonic acid (MOPS), pH 7.0, 0.3 mM EDTA, 0.01% β-mercaptorethanol, 0.004 % Brij 35 (a natural detergent), 0.5 % glycerol and 0.5 μg BSA/25 μl. The reaction was initiated by the addition of 0.04 μCi [γ-^{33}P]ATP (Amersham, UK) and unlabelled ATP at a final concentration of 1 μM and assay volume of 25 μl. After incubation for 20 minutes at room temperature, each reaction was terminated by the addition of 25 μl stop solution containing 5 mM EDTA, 50 μM ATP, 0.1 % Triton X-100 and 0.25 mg streptavidin coated Scintillation Proximity Assay (SPA) beads (Amersham, UK). After 6 hours the radioactivity was determined in a liquid scintillation counter (1450 MicroBeta Trilux, Wallac). The inhibition curves were analysed by non-linear regression using GraphPad Prism, USA. The K_m value of ATP for GSK3β, used to calculate the inhibition constants (K_i) of the various compounds, was 20 μM.

International application No.
PCT/SE2006/001116

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 64-66
because they relate to subject matter not required to be searched by this Authority, namely:

Claims 64-66 relate to a method of treatment of the human or animal body by surgery or by therapy, as well as diagnostic

.../...

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

The following separate inventions were identified:

1: Claims 1-59 and 62-67 directed to the compounds I and Ib and the use of compounds I and Ia as well as part of claims 60-61 directed to the intermediate compounds of imidazol-

.../...

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-59, 62-67 and part of 60-61

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

☐ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☐ No protest accompanied the payment of additional search fees.

Box II.1

methods /Rule 39.1(iv). Nevertheless, a search has been executed for these claims. The search has been based on the alleged effects of the compounds.

Box III

pyrimidine (compounds 1,9, 16, 20-21, 26-27, 34, 42 and 50-51).

2: Part of claims 60-61 directed to the intermediate compounds of aniline (compounds 2-4).

3: Part of claims 60-61 directed to the intermediate compounds of pyran-imidazole (compounds 6-8, 23-25 and 47-48).

4: Part of claims 60-61 directed to the intermediate compounds of methylpiperazin (compounds 10-11).

5: Part of claims 60-61 directed to the intermediate compounds of cyclohexyl-imidazole (compounds 13-15).

6: Part of claims 60-61 directed to the intermediate compounds of methylpiperidin-imidazole (compounds 17-19).

7: Part of claims 60-61 directed to the intermediate compounds of pyran-methylisoxazole and cyclohexyl-methylisoxazole (compounds 5, 12 and 46).

8: Part of claims 60-61 directed to the intermediate compounds of piperazin (compounds 22 and 28-30).

9: Part of claims 60-61 directed to the intermediate compounds of trifluoromethoxy benzoic acid (compound 31-32 and 36; 32 and 36 is the same compound).

10: Part of claims 60-61 directed to the intermediate compounds of morpholine (compounds 33 and 43).

11: Part of claims 60-61 directed to the intermediate compounds of azetidine (compounds 35 and 37).

12: Part of claims 60-61 directed to the intermediate compound of trifluoro-methylisoxazole (compound 38).

13: Part of claims 60-61 directed to the intermediate compounds of trifluoromethyl-imidazole (compounds 39-41).

.../...

14: Part of claims 60-61 directed to the intermediate compounds of bromophenyl-sulfonyl (compounds 44-45).

In order to fulfil the requirements of unity of invention, it is necessary that the intermediate compounds are closely interconnected with the end products. Such close connection requires that the essential structural part of the end product is incorporated by the intermediate compound. However, the present application lacks a single general inventive concept based on the above principle.

The present application has been considered to contain 14 inventions which are not linked such that they form a single general inventive concept, as required by Rule 13 PCT.
